## Exercise 1: Brzozowski-MCCluskey algorithm

The goal of this exercise is to translate a finite automaton into a rational expression, giving an alternate proof of the associated implication of Kleene's theorem. We will proceed by successive transformations of the automaton.

1. We call strongly normalized every automaton which has a unique initial state to which no transition leads and a unique final state with no exiting transition, i.e. an automaton $\mathcal{A}=\langle Q, \Sigma,\{i\},\{f\}, \delta\rangle$ such that for every state $q$ and letter $a,(q, a, i) \notin \delta$ and $(f, a, q) \notin \delta$. Show that for all finite automaton, there is a strongly normalized automaton which recognizes the same language.

We will use a generalization of the definition of finite automata: the transition function will be a subset of $Q \times 2^{\Sigma^{*}} \times Q$. An execution of such an automaton recognizes the concatenation of languages of the transitions' labels. The automaton recognizes the union of the languages of all its accepting executions.
2. Show that every generalized automaton is equivalent to a generalized automaton in which there exists exactly one transition between each pair of states: $q^{\prime} \in \delta(q, L)$ et $q^{\prime} \in \delta\left(q, L^{\prime}\right)$ implies $L=L^{\prime}$.
3. Let $\mathcal{A}$ be a strongly normalized generalized automaton with initial state $i$ and final state $f$. Let $q \in Q_{\mathcal{A}}, q \notin\{i, f\}$. Show that there exists an automaton equivalent to $\mathcal{A}$ with set of states $Q_{\mathcal{A}} \backslash\{q\}$.
4. Conclude that if $L$ is recognized by a strongly normalized generalized automaton $\mathcal{A}$, then $L$ belongs to the rational closure of the labels of the transitions of $\mathcal{A}$.
5. Show that every finite automaton has an equivalent generalized automaton.
6. Give a procedure which, given a finite automaton, outputs a rational expression of same language.
7. Apply the construction to compute a rational expression corresponding to the following automaton:

8. We consider the alphabet $\Sigma_{n}=[1 ; n] \times[1 ; n]$ and define:

$$
L=\left\{\left(a_{1}, a_{2}\right)\left(a_{2}, a_{3}\right) \ldots\left(a_{m}, a_{m+1}\right): m \geq 1, a_{1}=1, a_{m+1}=n\right\}
$$

(a) Give an automaton of linear size recognizing $L$.
(b) What is the size of the expression obtained by this construction on this automaton?

## Exercise 2: Minimization by Moore's algorithm

1. Minimize the automata $\mathcal{A}_{1}$ and $\mathcal{A}_{2}$, using Moore's algorithm:

(a) Automaton $\mathcal{A}_{1}$
2. Give a minimal automaton for $\mathcal{L}=\left(\left(a(a+b)^{2}+b\right)^{*} a(a+b)\right)^{*}$.

## Exercise 3: Flashback

We proved that the language of palindromes over alphabet $\Sigma=\{a, b\}$ is not recognizable. We say a palindrome is non trivial if its length is greater than or equal to 2 . Determine which of the following languages are recognizable (and prove it):

1. The language $L_{1}$ of words in $\Sigma^{*}$ containing a non trivial palindrome as a prefix.

(a) Automaton $\mathcal{A}_{2}$
2. The language $L_{2}$ of words in $\Sigma^{*}$ containing a non trivial palindrome of even length as a prefix.

## Contrôle continu 4

À rendre pour le 29/02 à 16 h15.

## Exercise 4: Résiduels

Calculer les résiduels de $\mathcal{L}=a^{*}(a a+b)+b(a+b a)^{*}$ et construire son automate minimal.

## Exercise 5: Characterizing recognizability

We want to show a converse to the pumping lemma. We say that a language $L$ satisfies $P_{h}$ if for all $u v_{1} \ldots v_{h} w$ avec $\left|v_{i}\right| \geq 1$, there exists $0 \leq j<k \leq h$ such that

$$
u v_{1} \ldots v_{h} w \in L \Leftrightarrow u v_{1} \ldots v_{j} v_{k+1} \ldots v_{h} w \in L .
$$

The theorem of Ehrenfeucht, Parikh \& Rozenberg states that $L$ is rational iff there exists $h$ such that $L$ satisfies $P_{h}$.

1. Show that if $L$ satisfies $P_{h}$, then $w^{-1} L$ also does for every word $w \in \Sigma^{*}$.
2. Let $h \in \mathbb{N}$. We want to show that the number of languages satisfying $P_{h}$ is finite. We use the following statement of Ramsey's theorem:

For every $k$ there is $N$ such that, for every set $E$ of cardinal greater than $N$ and every bipartition $\mathcal{P}$ of $\mathfrak{P}_{2}(E)=\left\{\left\{e, e^{\prime}\right\}: \quad e, e^{\prime} \in\right.$ $\left.E, e \neq e^{\prime}\right\}$, there exists a subset $F \subseteq E$ of cardinal $k$ such that $\mathfrak{P}_{2}(F)$ is contained in one of the classes of $\mathcal{P}$.

Let $N$ be the natural number given by Ramsey's theorem for $k=h+1$. Let $L$ and $L^{\prime}$ be two languages satisfying $P_{h}$ and coinciding on words of size smaller than $N$. Prove that they coincide on words or size $M \geq N$, by induction on $M$. You may consider, for a word $f=a_{1} \ldots a_{N} t$ of size $M$ (with $a_{i} \in \Sigma$ ), the following partition of $\mathfrak{P}_{2}([0 ; N])$ :

$$
\begin{gathered}
X_{f}=\left\{(j, k): 0 \leq j<k \leq N, a_{1} \ldots a_{j} a_{k+1} \ldots a_{N} t \in L\right\} \\
Y_{f}=\mathfrak{P}_{2}([0 ; N]) \backslash X_{f}
\end{gathered}
$$

Conclude.
3. Conclude that if a language $L$ satisfies $P_{h}$ for some $h$, then $L$ is regular.
